BETA 0.6.0

Your network, watched calmly.

Meet GWatch, and join the beta. Swipe to see what it does.

WHAT IT IS

One calm place for everything on your network.

- **It checks**

  Router, servers, websites, APIs, certificates and hardware, on a schedule.

- **It remembers**

  Years of history in one small database, rolled up so it never bloats.

- **It speaks up only when it should**

  No alert storms: thresholds, cooldowns, maintenance and dependencies.

THE DASHBOARD

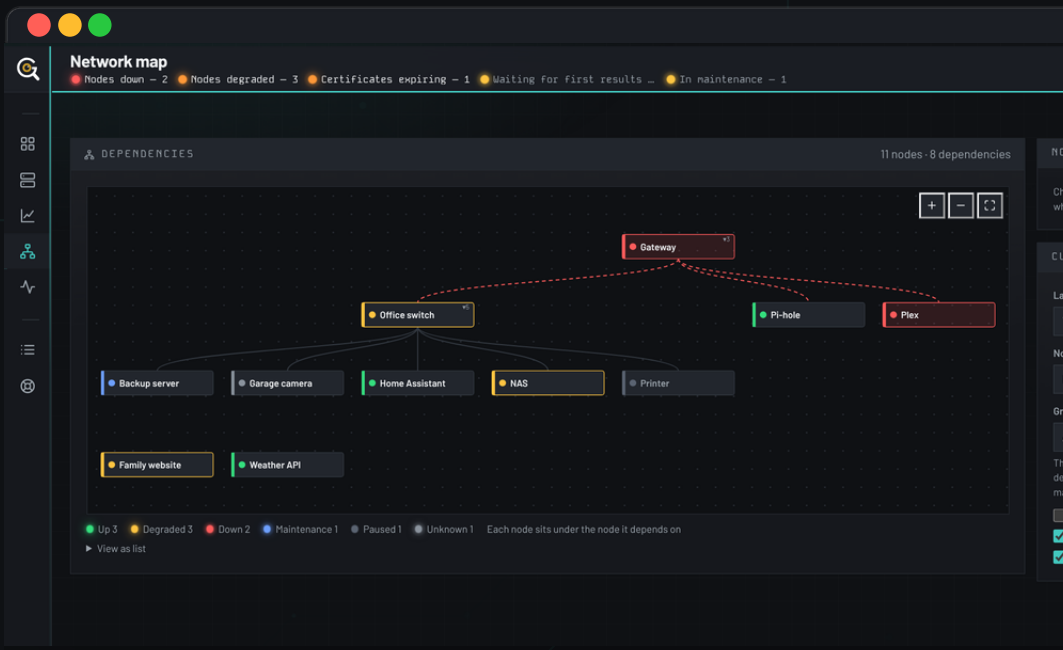

Everything, at a glance.

The real interface, showing its built-in demo network.

THE NETWORK MAP

See what an outage really hits.

Every node sits under the one it depends on, so when the gateway drops, you get one alert, not eleven.

IN THE BOX

Small to install. Big on what it does.

10
check types

8
ways to notify

3
database choices

5
places it runs

0
cloud accounts

100%
signed releases

THE BETA IS OPEN

Run it early. Shape 1.0.

01 **Install 0.6.0**

Windows installer, Docker image or Linux/macOS build, signed and free.

02 **Watch your real network**

Your router, NAS, Pi-hole, websites and APIs: whatever you run.

03 **Tell us everything**

Bugs, rough edges and the features you wish it had, on GitHub Issues.
