GWatch

BETA 0.6.0

Your home network, watched calmly.

GWatch checks your router, servers, websites and services on a schedule, keeps the history, and only speaks up when something actually needs you. You're invited to run the beta before anyone else.

Checks everything

Ping, HTTP/S, certificates, ports, DNS, keywords, JSON, SNMP, hardware health and your own scripts.

Sees the whole picture

A live network map traces what an outage really takes down, beneath the device that failed.

Acts for you

Email, Slack, Teams, ntfy, Pushover, webhooks, git and scripts when something changes.

Alerts that don't nag

After N failures, on recovery, with cooldowns, silences, maintenance windows and dependency-aware quiet.

Remembers

Long-term history, charts that stack today over last week, incidents and availability reports.

Stays home

No cloud account, nothing phoned home, never internet-facing on its own. Signed updates, encrypted backups.

Join the beta in three steps

01 Install 0.6.0

Windows installer, Docker image or Linux/macOS build, signed and free.

02 Watch your real network

Your router, NAS, Pi-hole, websites and APIs: whatever you run.

03 Tell us everything

Bugs, rough edges and the features you wish it had, on GitHub Issues.
