GWatch

Your home network, watched calmly.

BETA 0.6.0

You're invited to the beta.

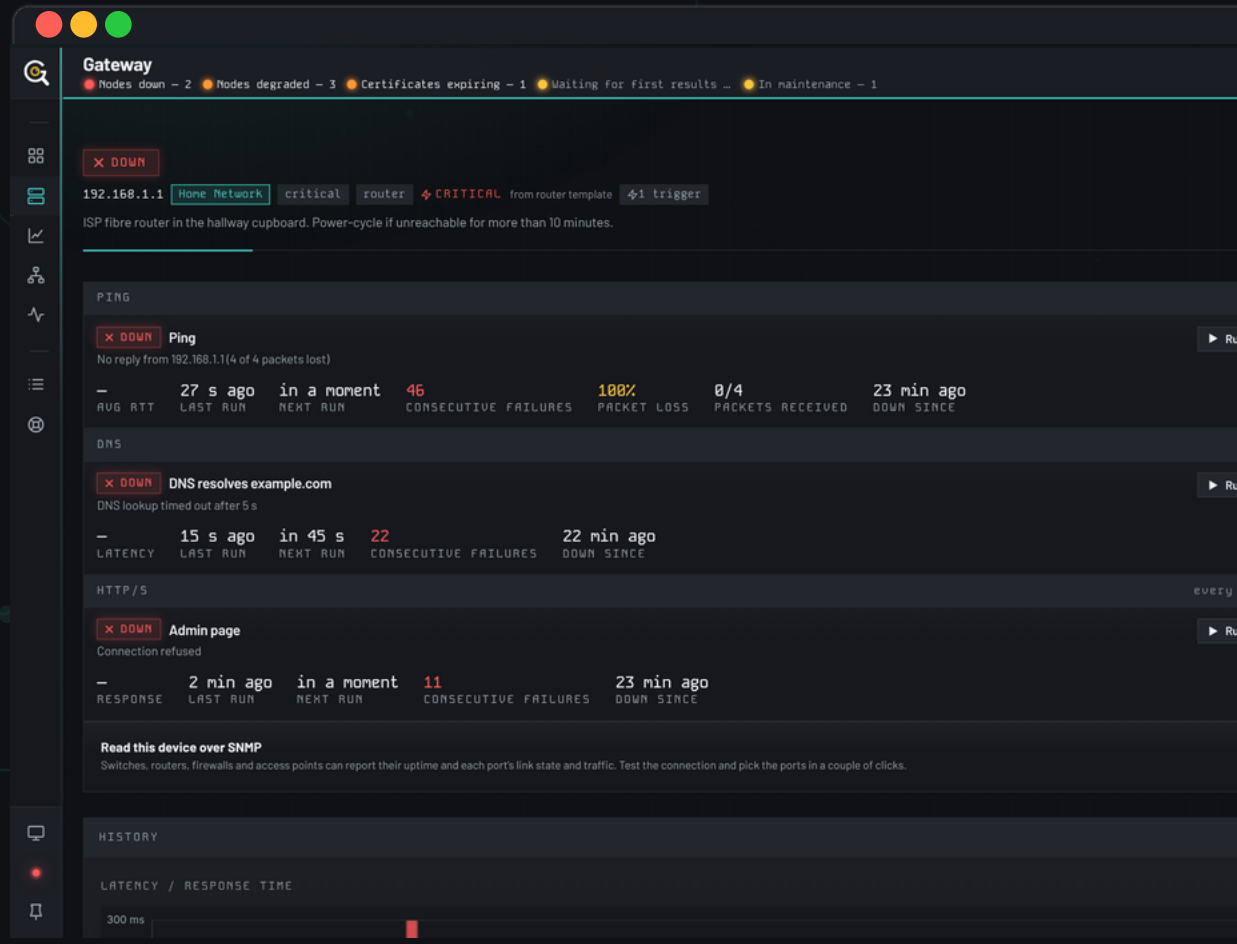

WHAT IT IS

A calm monitor for everything you run.

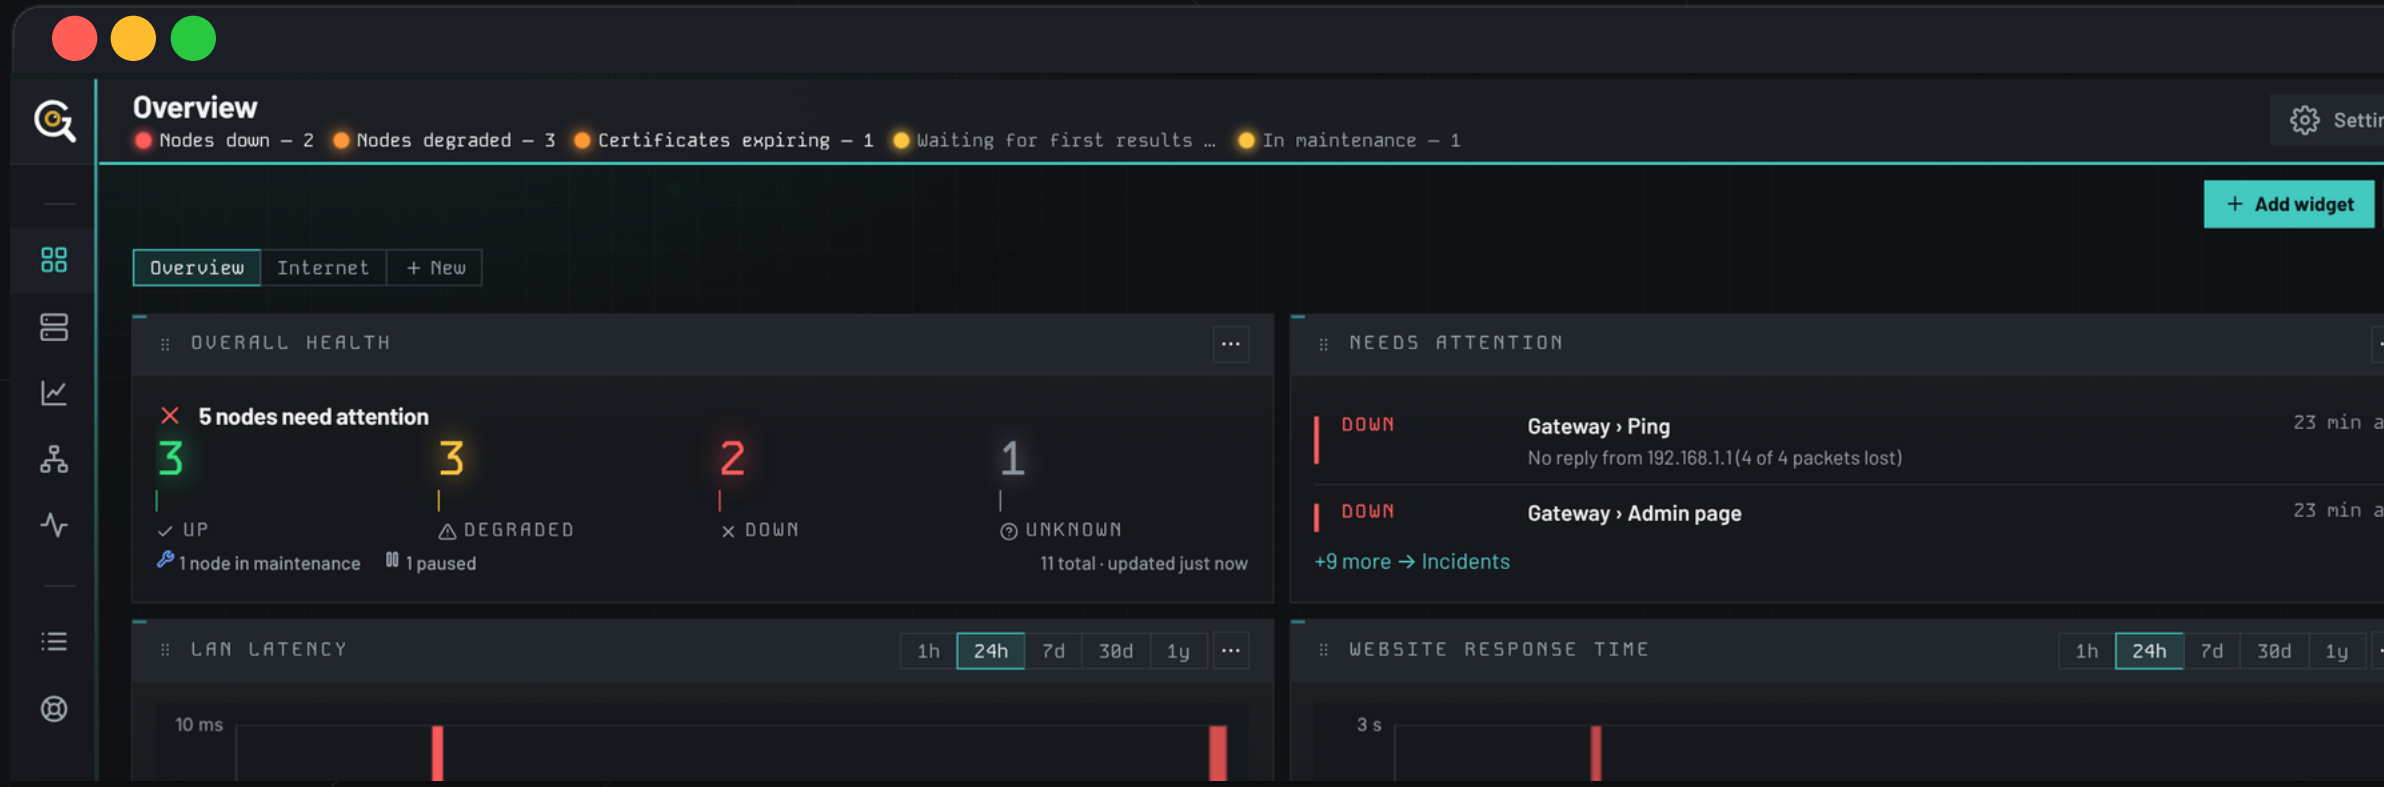

GWatch checks your router, servers, websites and services on a schedule, keeps the history, and only speaks up when something actually needs you.

- Ping
- HTTP/S
- Certificates
- TCP port
- DNS
- Keyword
- JSON
- Custom script
- Hardware health
- SNMP

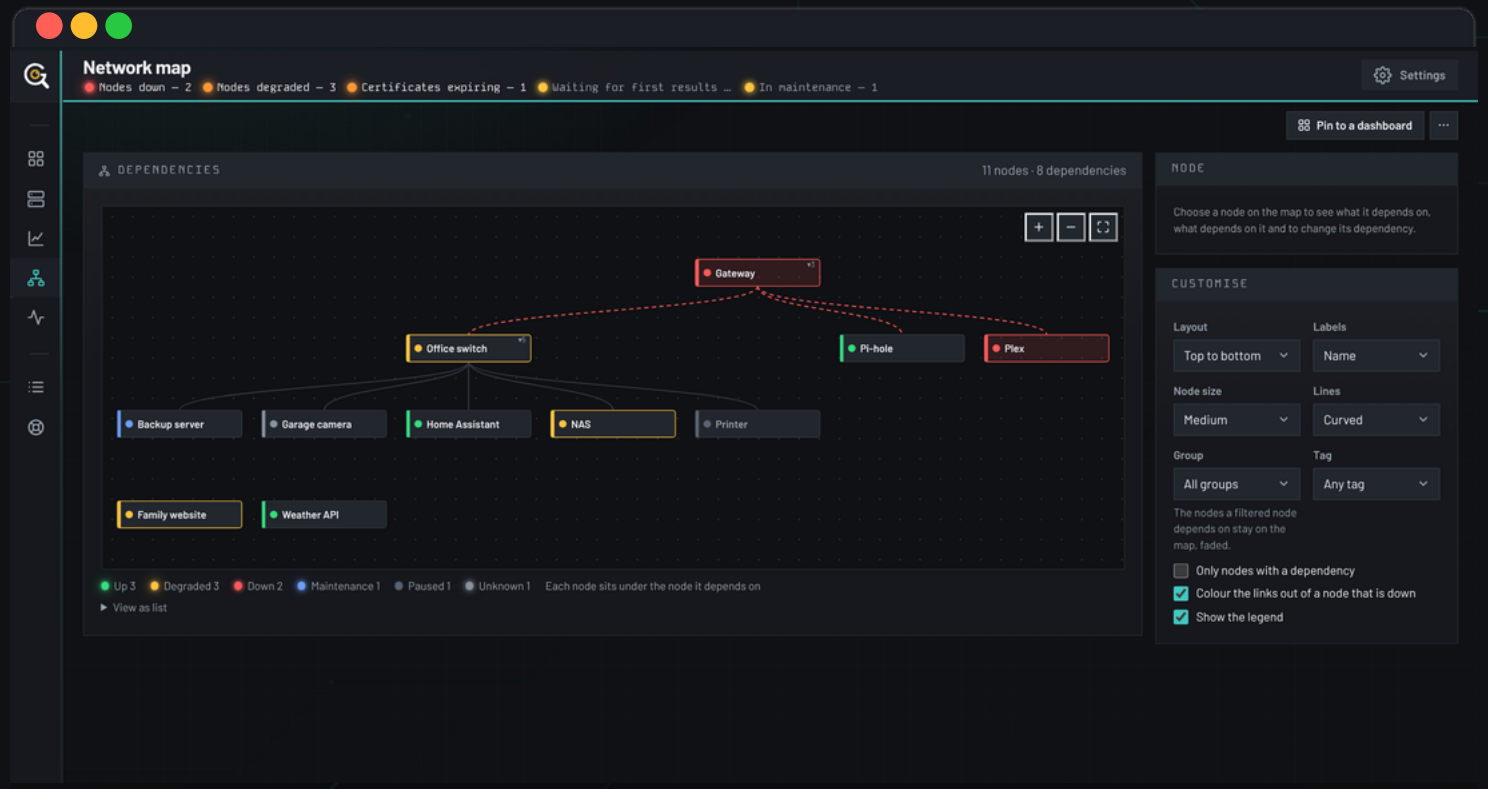

THE DASHBOARD

Everything, at a glance.

THE NETWORK MAP

One outage. One alert.

- **Dependencies**

  The firewall on top; everything it would silence beneath.

- **Three layouts**

  Styled to taste, edited in place.

- **Pin it**

  Put the map on any dashboard or wallboard.

WHY IT'S GOOD

Robust enough to trust.
Simple enough to enjoy.

Checks everything

Ping, HTTP/S, certificates, ports, DNS, keywords, JSON, SNMP, hardware health and your own scripts.

Alerts that don't nag

After N failures, on recovery, with cooldowns, silences, maintenance windows and dependency-aware quiet.

Sees the whole picture

A live network map traces what an outage really takes down, beneath the device that failed.

Remembers

Long-term history, charts that stack today over last week, incidents and availability reports.

Acts for you

Email, Slack, Teams, ntfy, Pushover, webhooks, git and scripts when something changes.

Stays home

No cloud account, nothing phoned home, never internet-facing on its own. Signed updates, encrypted backups.

RUNS WHERE YOU DO

Your hardware.
Your data.

5

places it runs

Windows, Linux, macOS, Docker, Raspberry Pi

3

database choices

SQLite built in, or PostgreSQL / MySQL

8

ways to notify

Email, Webhooks, Slack, Teams, ntfy, Pushover, git and scripts

0

cloud accounts

Nothing leaves your network

THE BETA

It works. Now help us make it great.

Find the bugs

Anything that looks wrong, reads wrong or stops working.

Spot the rough edges

The screen that confused you, the setting you couldn't find.

Ask for features

What would make GWatch the one you'd recommend?

Beta builds are signed, update themselves, and back up with one click, so trying it is low-risk.

HOW TO JOIN

Three steps. Ten minutes.

01

Install 0.6.0

Windows installer, Docker image or Linux/macOS build, signed and free.

02

Watch your real network

Your router, NAS, Pi-hole, websites and APIs: whatever you run.

03

Tell us everything

Bugs, rough edges and the features you wish it had, on GitHub Issues.

```
